

Introduction

Mediastray is an online gaming platform where the users can register to publish their own games and play the other user's ones. The games can be downloaded for executing them locally as well as playing them in the very website using the WebGL technology. Also the platform includes social network features such as being able to follow games and users, a comments and reports system, advanced customization, etc. The platform consists in a Backend and a Frontend, being both of them deployable with Docker having also four databases for different use cases.
